

Machine Learning: Course Introduction

Seung-Hoon Na

2024.9.3

Contents

- Introduction ◀
 - Goal & Tasks & Applications
 - Related disciplines
 - Artificial intelligence, Machine learning, Linguistics, etc.
- Natural language processing: Methods
 - Methods
 - Rule-based approach: ELIZA
 - Statistical method: HMM, PCFG
 - Deep learning: Word2vec, RNN, LSTM, Transformer
 - Pretrained language model: BERT
 - Large language model: GPT3
 - Human-aligned LLM: ChatGPT
 - LLM for X: Multimodal & Robotics, Others
- Course schedule

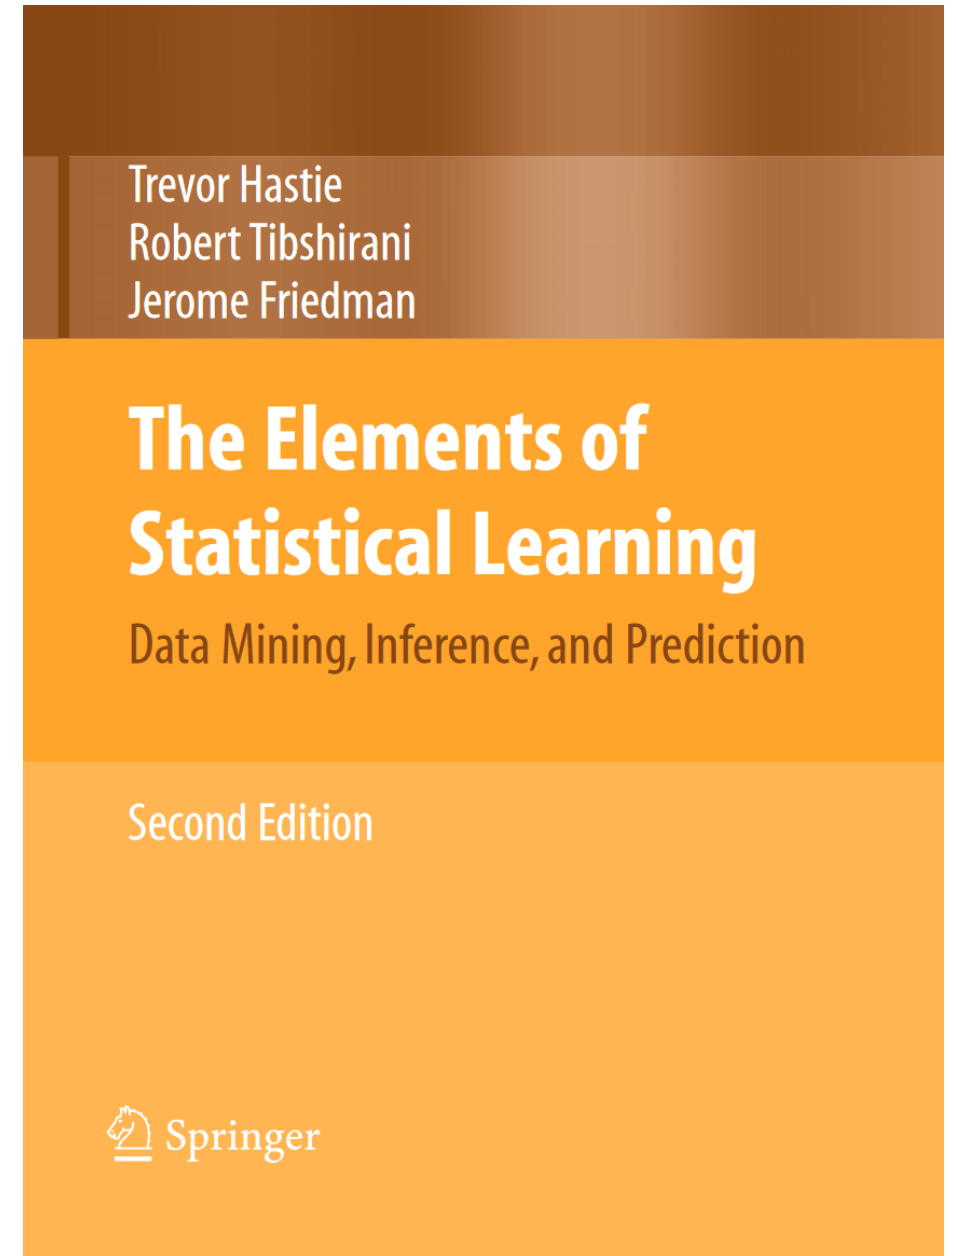

Machine Learning

- Handcraft approach to developing programs: Limited in implementing various AI tasks
 - How we directly write programs for these AI tasks?
 - Understanding human language
 - Recognize human faces and objects
- Machine learning (By Tom Mitchell)
 - *A computer program is said to learn from experience E with respect to some class of tasks T and performance measure P , if its performance at tasks in T , as measured by P , improves with experience E .*
- Machine learning (Wikipedia)
 - A field of study in artificial intelligence concerned with the development and study of statistical algorithms that can **learn from data and generalize to unseen data** and thus perform tasks without explicit instructions.

Machine Learning

- Relationships to other fields
 - Artificial Intelligence, Statistics, Data mining, etc.
- This course covers the following topics
 - Machine learning basics
 - kNN, Decision tree
 - Linear regression, classification
 - Logistic regression
 - Probabilistic machine learning approaches
 - Bayesian approaches
 - Naïve Bayesian model
 - Mixture models
 - Approximate inference
 - ✓ EM, Variational inference
 - ✓ Sampling
 - Kernel machine learning
 - SVM, relevance vector machine
 - Neural network and deep learning basics

Machine Learning and Data Mining

[Overview](#) | [Homeworks](#) | [Exams](#) | [Lectures](#) | [Tutorials](#) | [Paper Readings](#) | [Resources](#)

Overview

Machine learning is a set of techniques that allow machines to learn from data and experience, rather than requiring humans to specify the desired behavior by hand. Over the past two decades, machine learning techniques have become increasingly central both in AI as an academic field, and in the technology industry. This course provides a broad introduction to some of the most commonly used ML algorithms. It also serves to introduce key algorithmic principles which will serve as a foundation for more advanced courses, such as CSC412/2506 (Probabilistic Learning and Reasoning) and CSC421/2516 (Neural Networks and Deep Learning).

The first half of the course focuses on supervised learning. We begin with nearest neighbours, decision trees, and ensembles. Then we introduce parametric models, including linear regression, logistic and softmax regression, and neural networks. We then move on to unsupervised learning, focusing in particular on probabilistic models, but also principal components analysis and K-means. Finally, we cover the basics of reinforcement learning.

[INSTRUCTORS
LECTURE](#)

ABOUT THIS COURSE

This course covers a wide variety of introductory topics in machine learning and statistical models including boosting, latent variable models and so on. The primary goal is to provide students with the tools [here](#).

For registration information, please contact [CS Graduate Office](#).

PREREQUISITES

If you'd like to waive the prerequisites, please send an email to the instructor. For each prerequisite,

- **Solid mathematical background:** equivalent to a 1-semester undergraduate course in each of t
- **Computer science background:** equivalent to 1-semester undergraduate course in data structu
- *Recommended:* At least one advanced, proof-based mathematics course
- Some prerequisites may be waived with permission of the instructor

Course Schedule

- Introduction
- Classical machine learning: kNN, Decision Tree
- Linear Regression
- Linear Classification
- Neural networks
- Deep learning basics
- Kernel Machine

Course Schedule

- k-Means
- GMM
- Expectation Maximization
- Bayesian Linear Regression
- Gaussian Processes
- Variational inference
- Sampling methods
