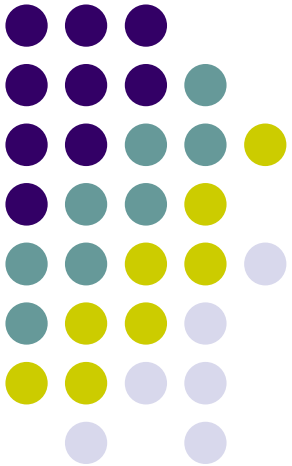
Junction tree Algorithm

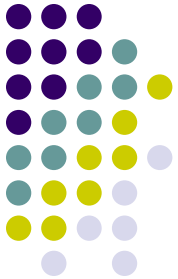
10-708:Probabilistic Graphical Models

Recitation: 10/04/07

Ramesh Nallapati

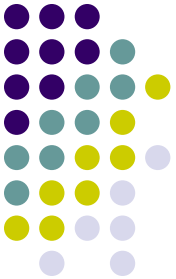


Cluster Graphs

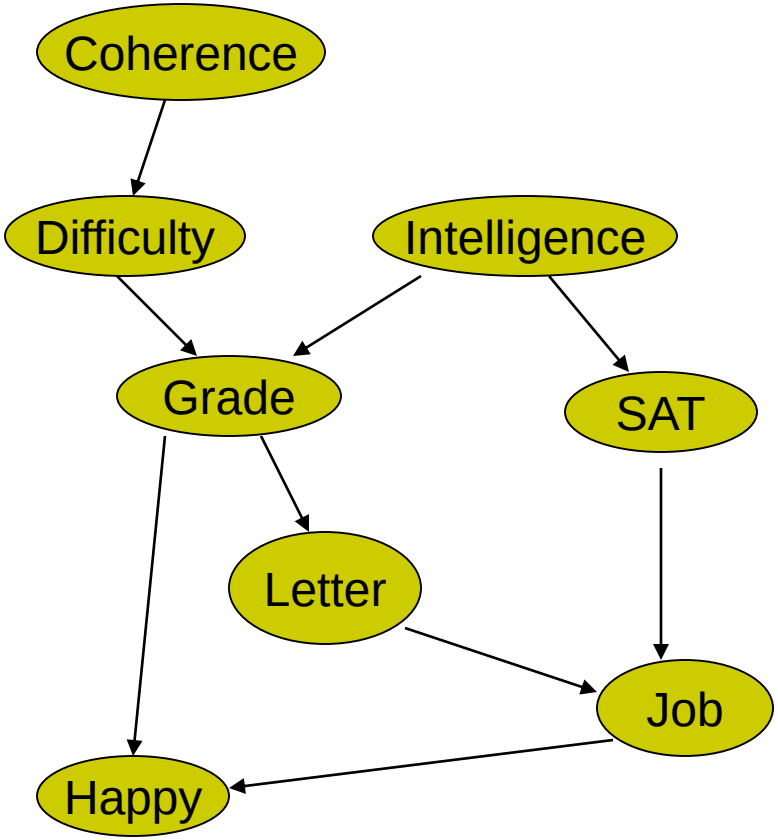


- A cluster graph *K* for a set of factors *F* is an undirected graph with the following properties:
  - Each node *i* is associated with a subset $C_i \subset X$
  - Family preserving property: each factor ϕ is such that scope[ϕ] $\subseteq C_i$
  - Each edge between C_i and C_j is associated with a sepset $S_{ij} = C_i \cap C_j$
- Execution of variable elimination defines a cluster-graph
  - Each factor used in elimination becomes a cluster-node
  - An edge is drawn between two clusters if a message is passed between them in elimination
  - Example: Next slide ➔

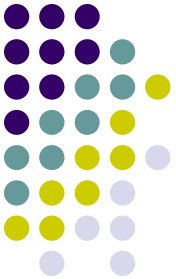
Variable Elimination to Junction Trees:



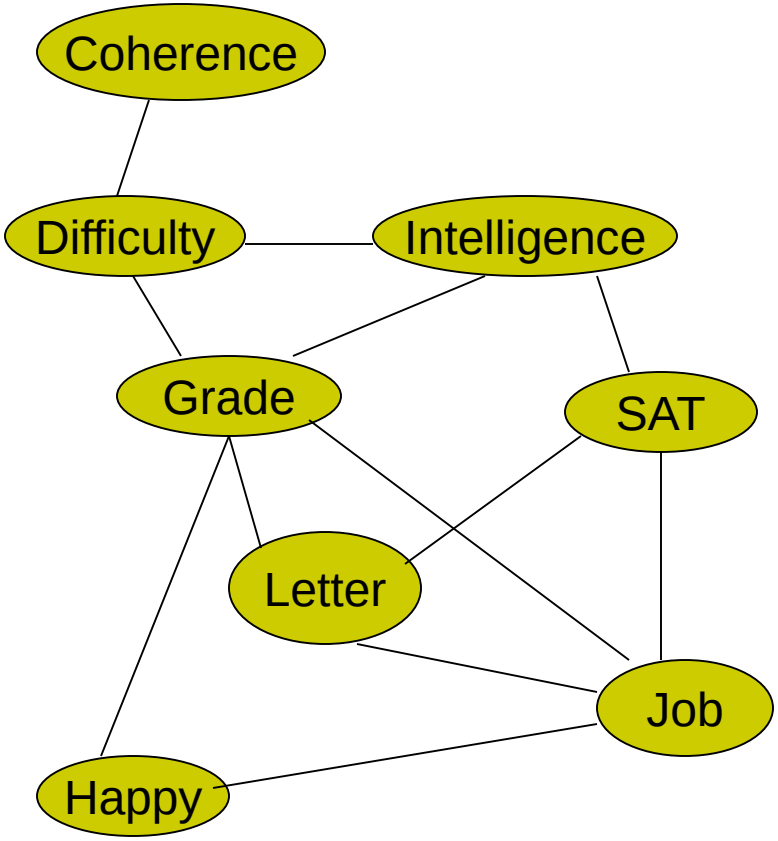
- Original graph



Variable Elimination to Junction Trees:

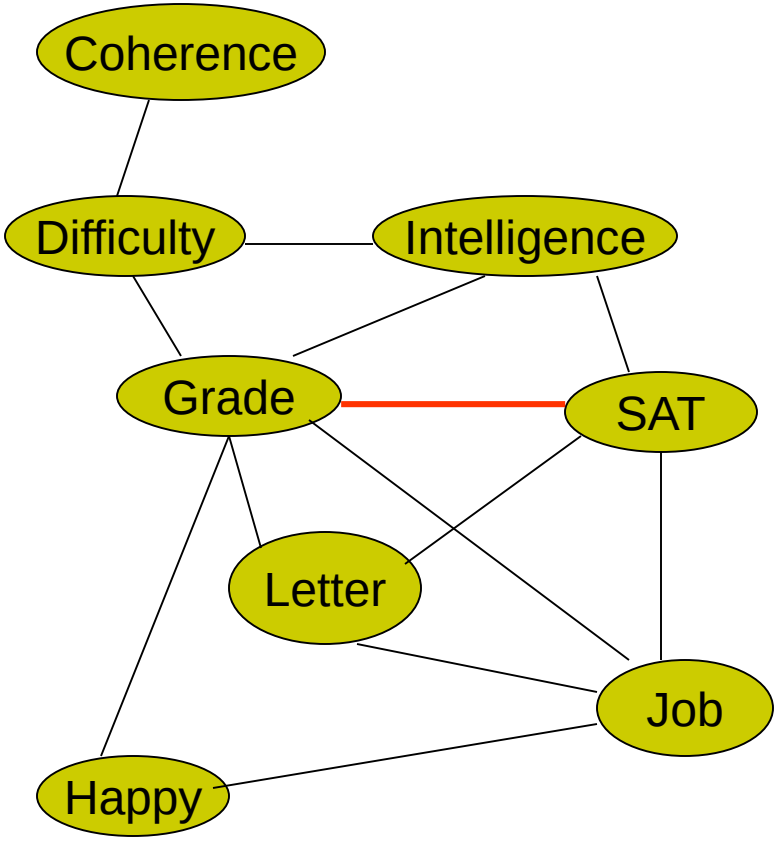


- Moralized graph



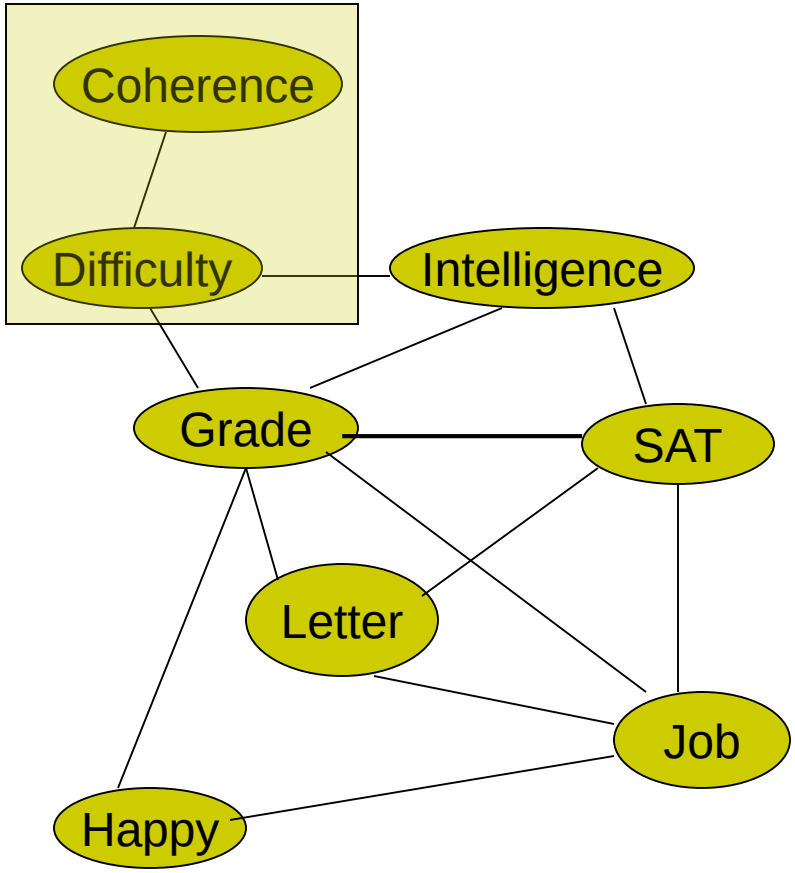
Variable Elimination to Junction Trees:

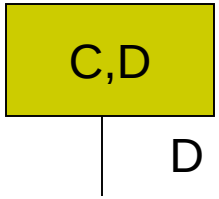
- Triangulated graph



Variable Elimination to Junction Trees:

- Elimination ordering: ~~C~~, D, I, H, G, S, L

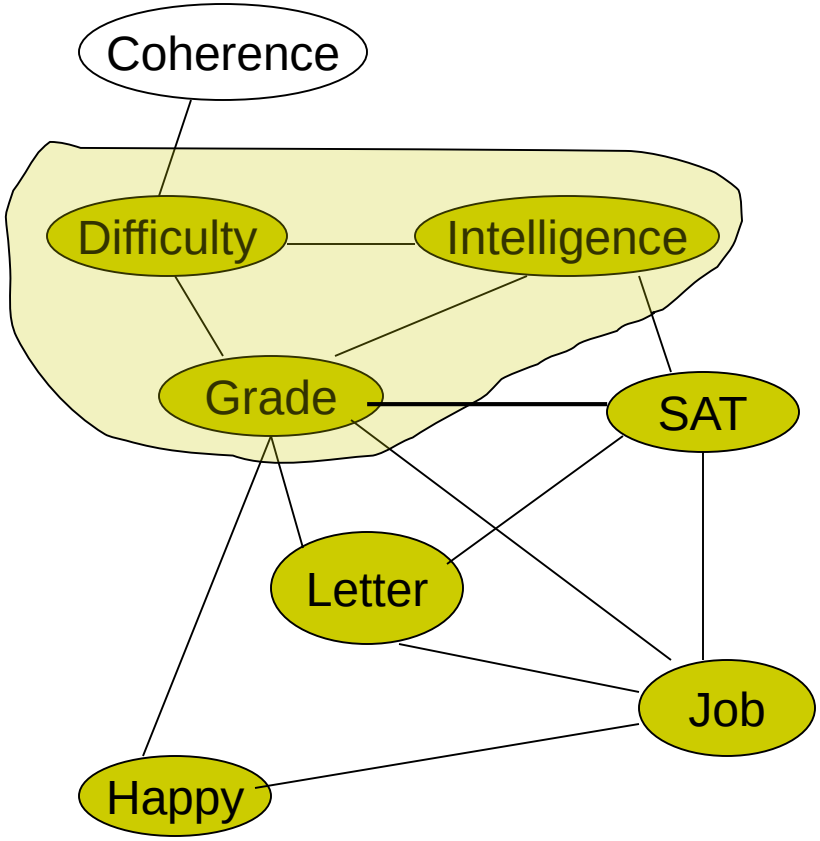


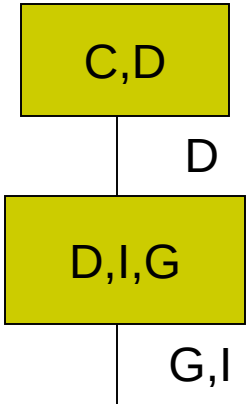


$$m_C(D) = \sum_C P(C)P(D|C)$$

Variable Elimination to Junction Trees:

- Elimination ordering: ~~C~~, ~~D~~, I, H, G, S, L

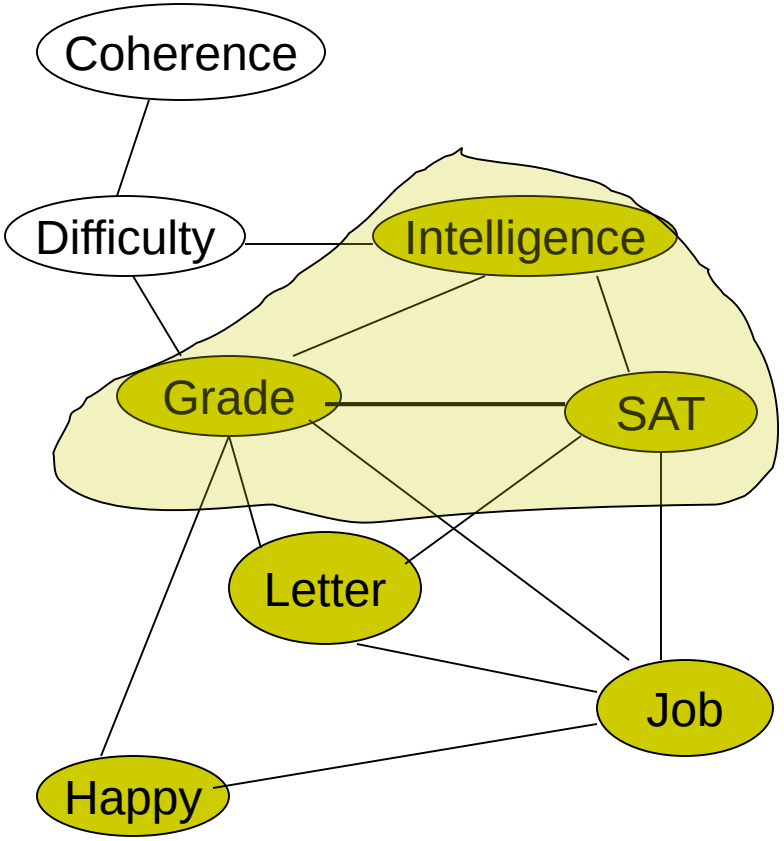


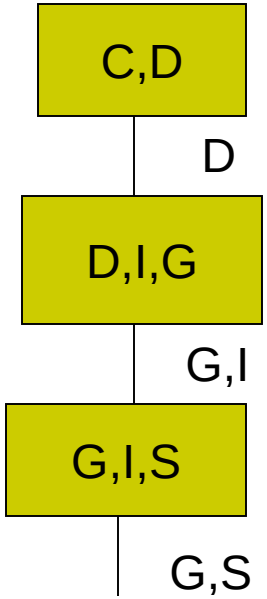


$$m_D(G,I) = \sum_D m_C(D) P(G|D,I)$$

Variable Elimination to Junction Trees:

- Elimination ordering: ~~C~~, ~~D~~, ~~I~~, H, G, S, L

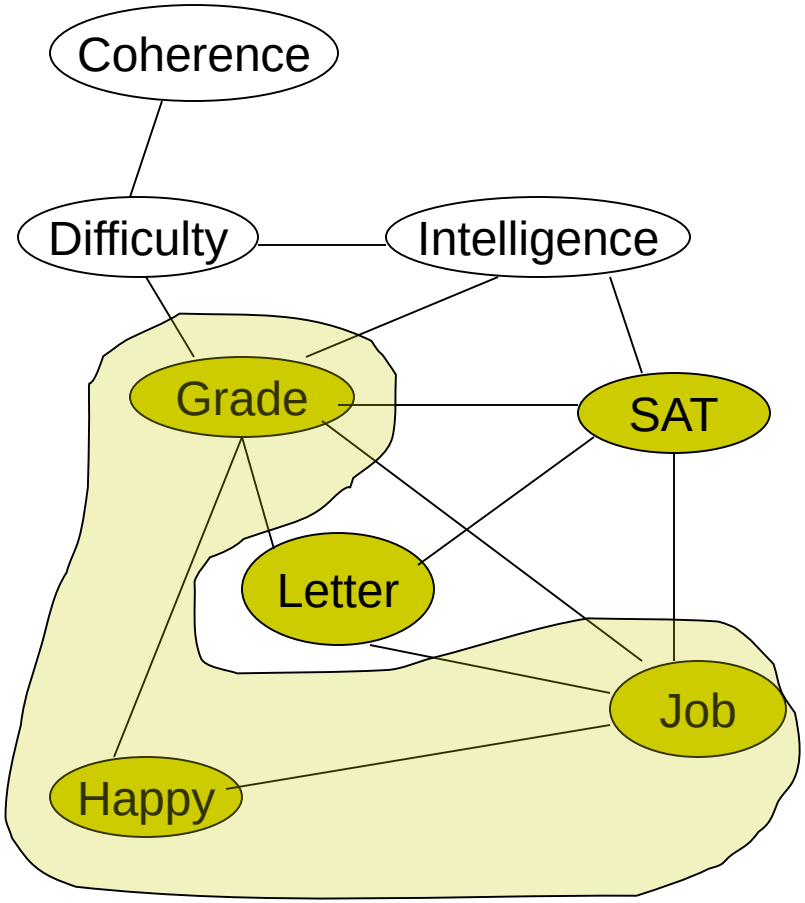


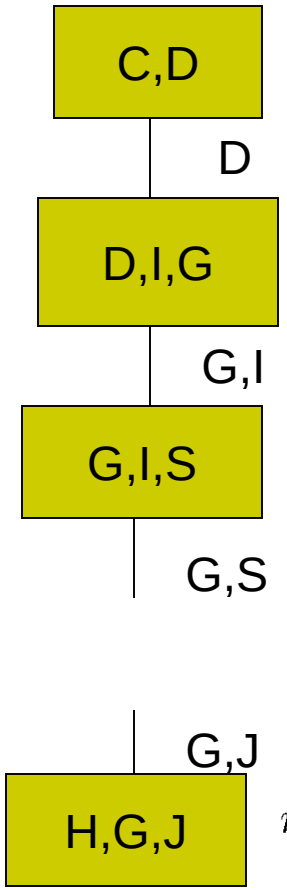


$$m_I(G,S) = \sum_I m_D(G,I)P(G|I)P(S|I)$$

Variable Elimination to Junction Trees:

- Elimination ordering: ~~C~~, ~~D~~, ~~I~~, ~~H~~, G, S, L

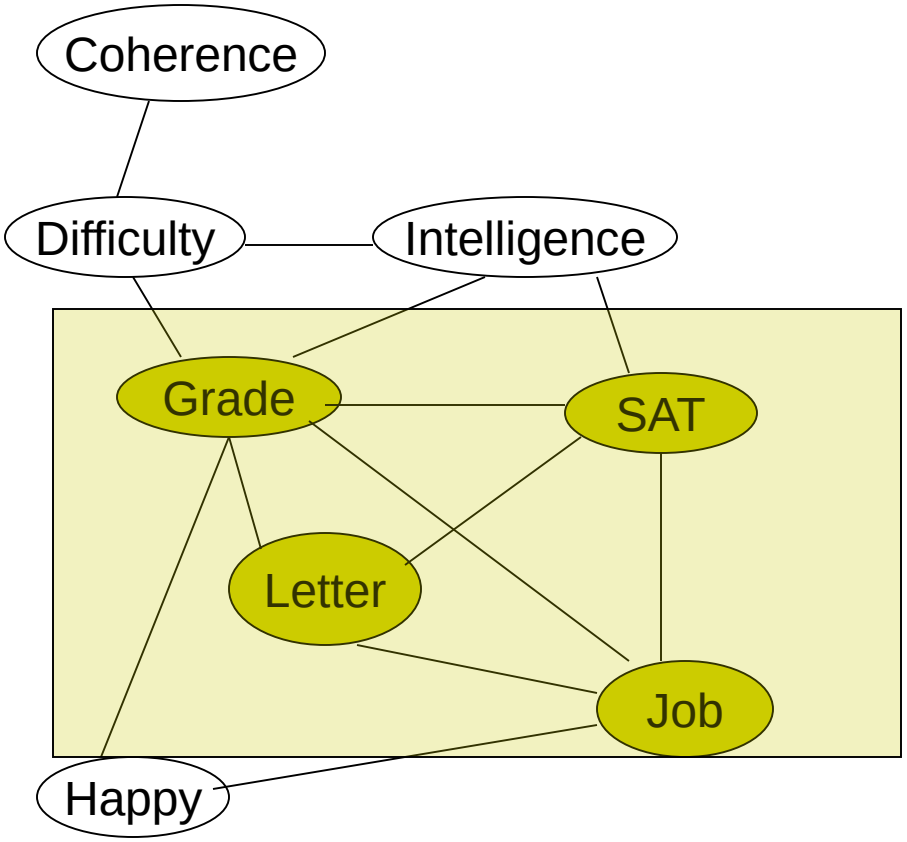


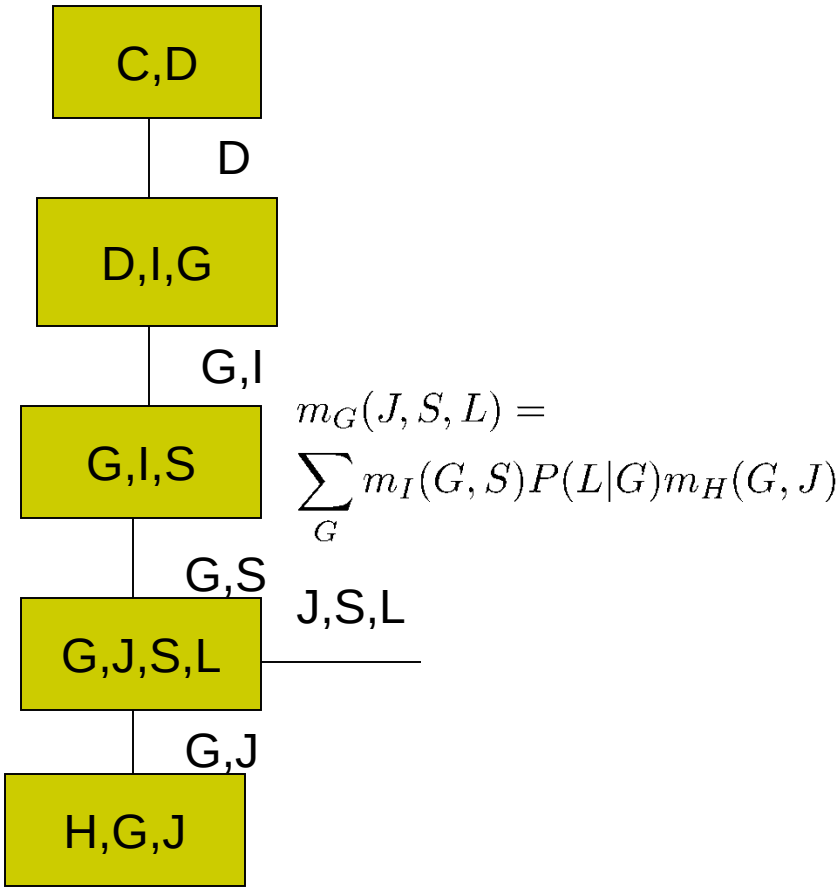


$$m_H(G,J) = \sum_H P(H|G,J)$$

Variable Elimination to Junction Trees:

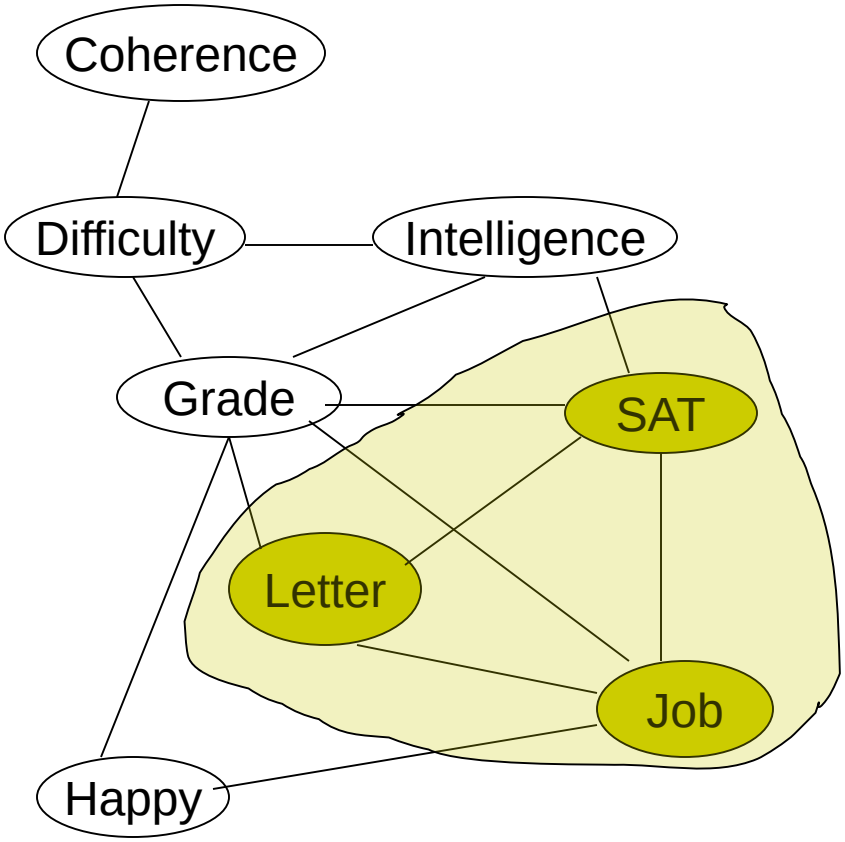
- Elimination ordering: ~~C~~, ~~D~~, ~~I~~, ~~H~~, ~~G~~, S, L

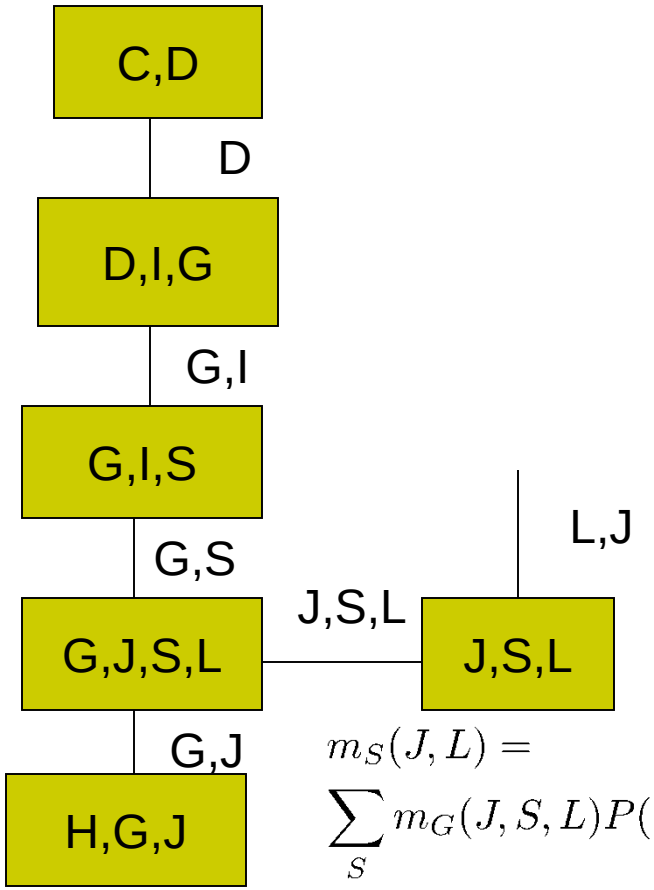




Variable Elimination to Junction Trees:

- Elimination ordering: ~~C~~, ~~D~~, ~~I~~, ~~H~~, ~~G~~, ~~S~~, L

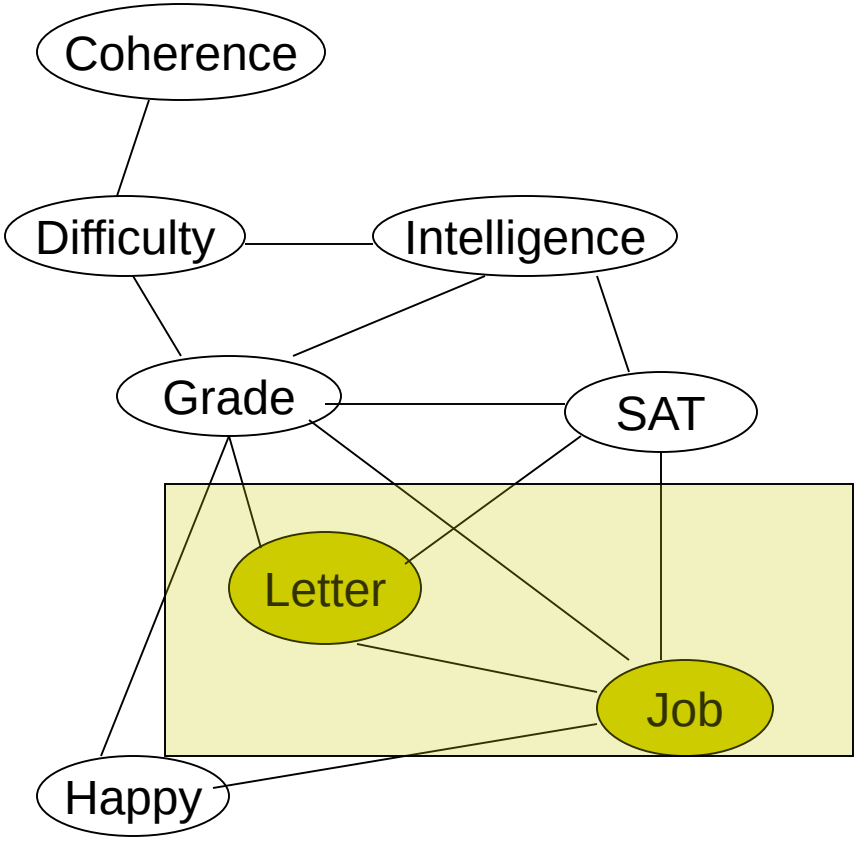


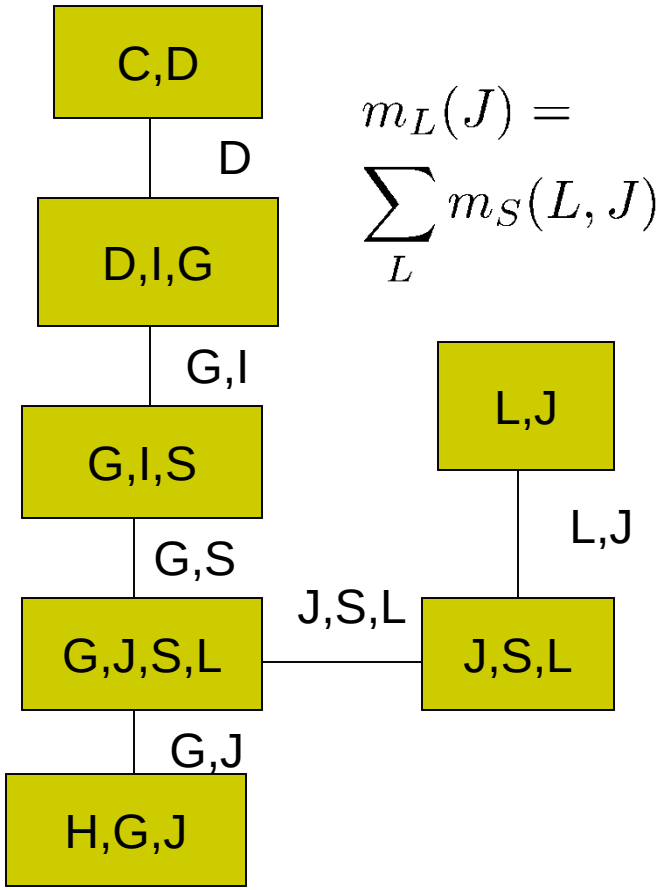


$$m_S(J,L) = \sum_S m_G(J,S,L)P(J|L,S)$$

Variable Elimination to Junction Trees:

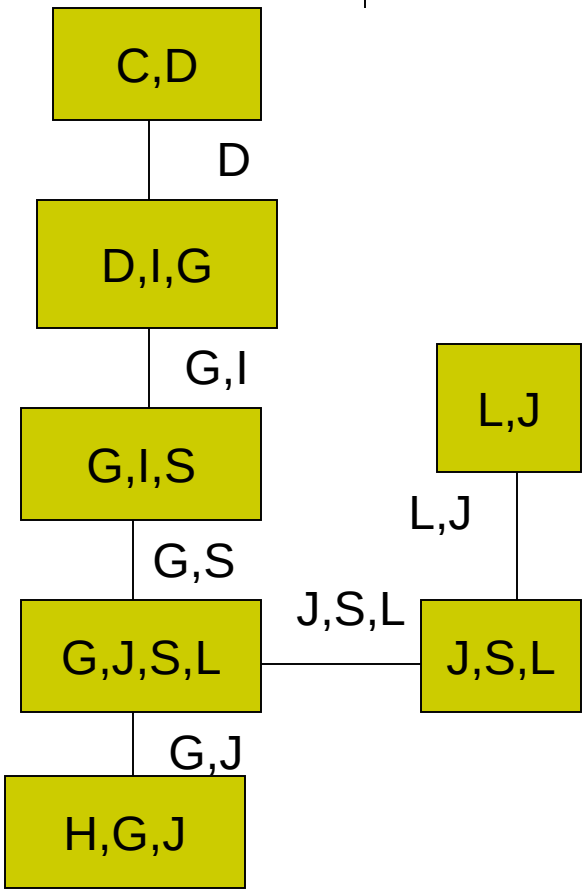
- Elimination ordering: ~~C~~, ~~D~~, ~~I~~, ~~H~~, ~~G~~, ~~S~~, ~~L~~





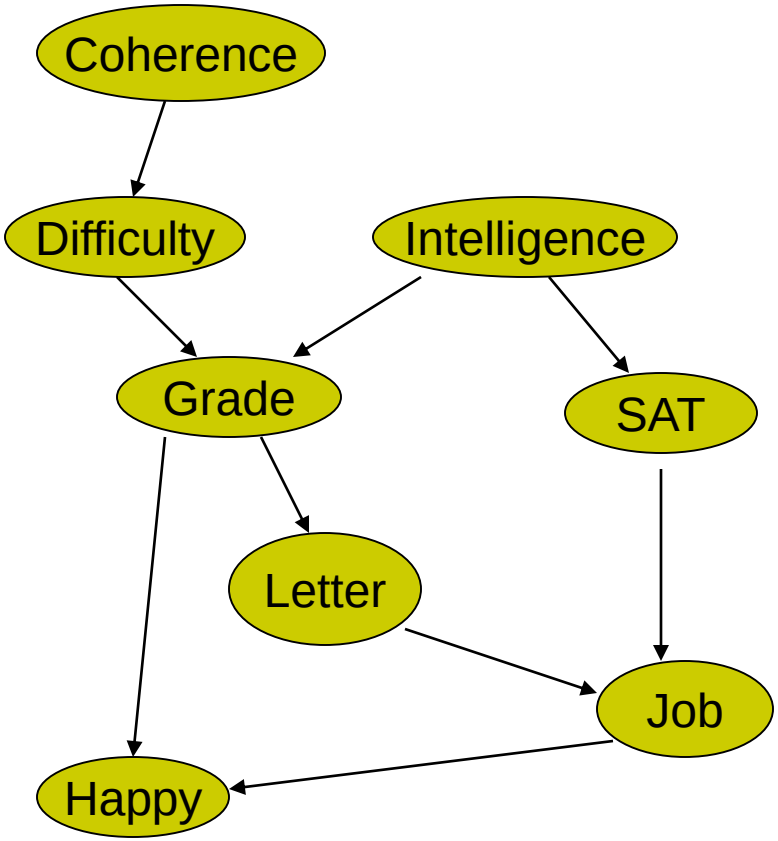
Properties of Junction Tree

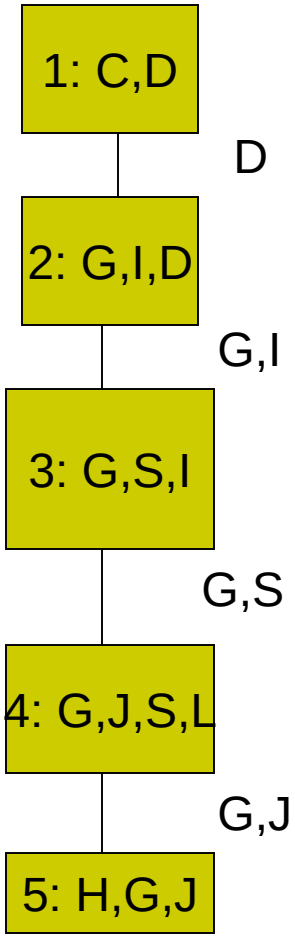
- Cluster-graph *G* induced by variable elimination is necessarily a tree
  - Reason: each intermediate factor is used atmost once
- G satisfies Running Intersection Property (RIP)
  - $(X \in C_i \ \& \ X \text{ in } C_j) \Rightarrow X \in C_K$ where C_k is in the path of C_i and C_j
- If C_i and C_j are neighboring clusters, and C_i passes message m_{ij} to C_j, then scope$[m_{ij}] = S_{i,j}$
- Let *F* be set of factors over *X*. A cluster tree over *F* that satisfies RIP is called a junction tree
- One can obtain a minimal junction tree by eliminating the sub-cliques
  - No redundancies



Junction Trees to Variable elimination:

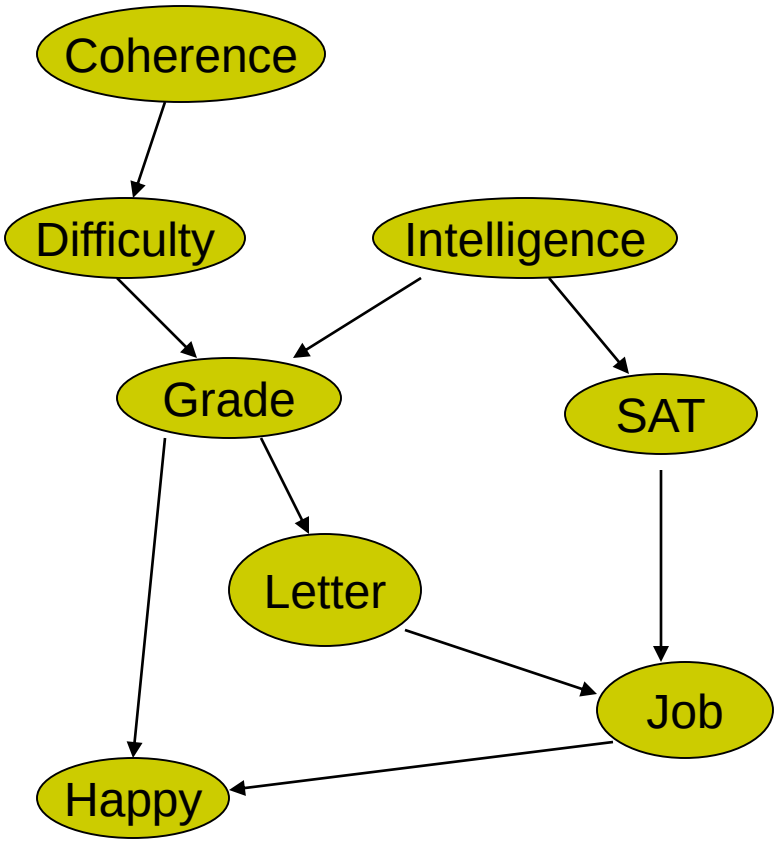
- Now we will assume a junction tree and show how to do variable elimination

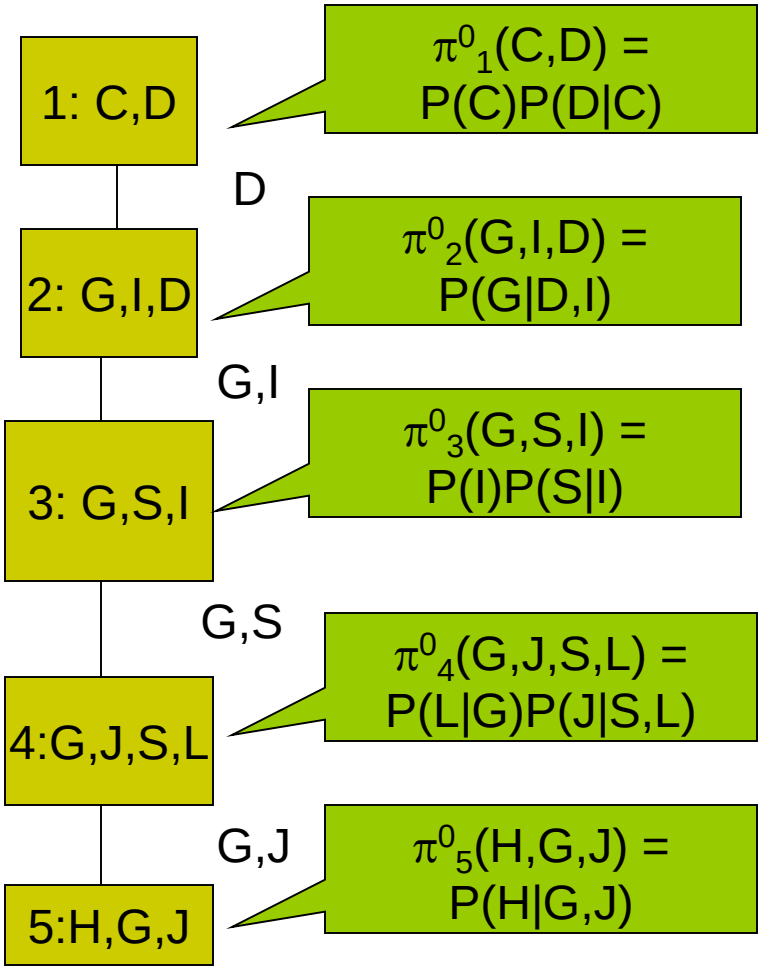




Junction Trees to Variable Elimination:

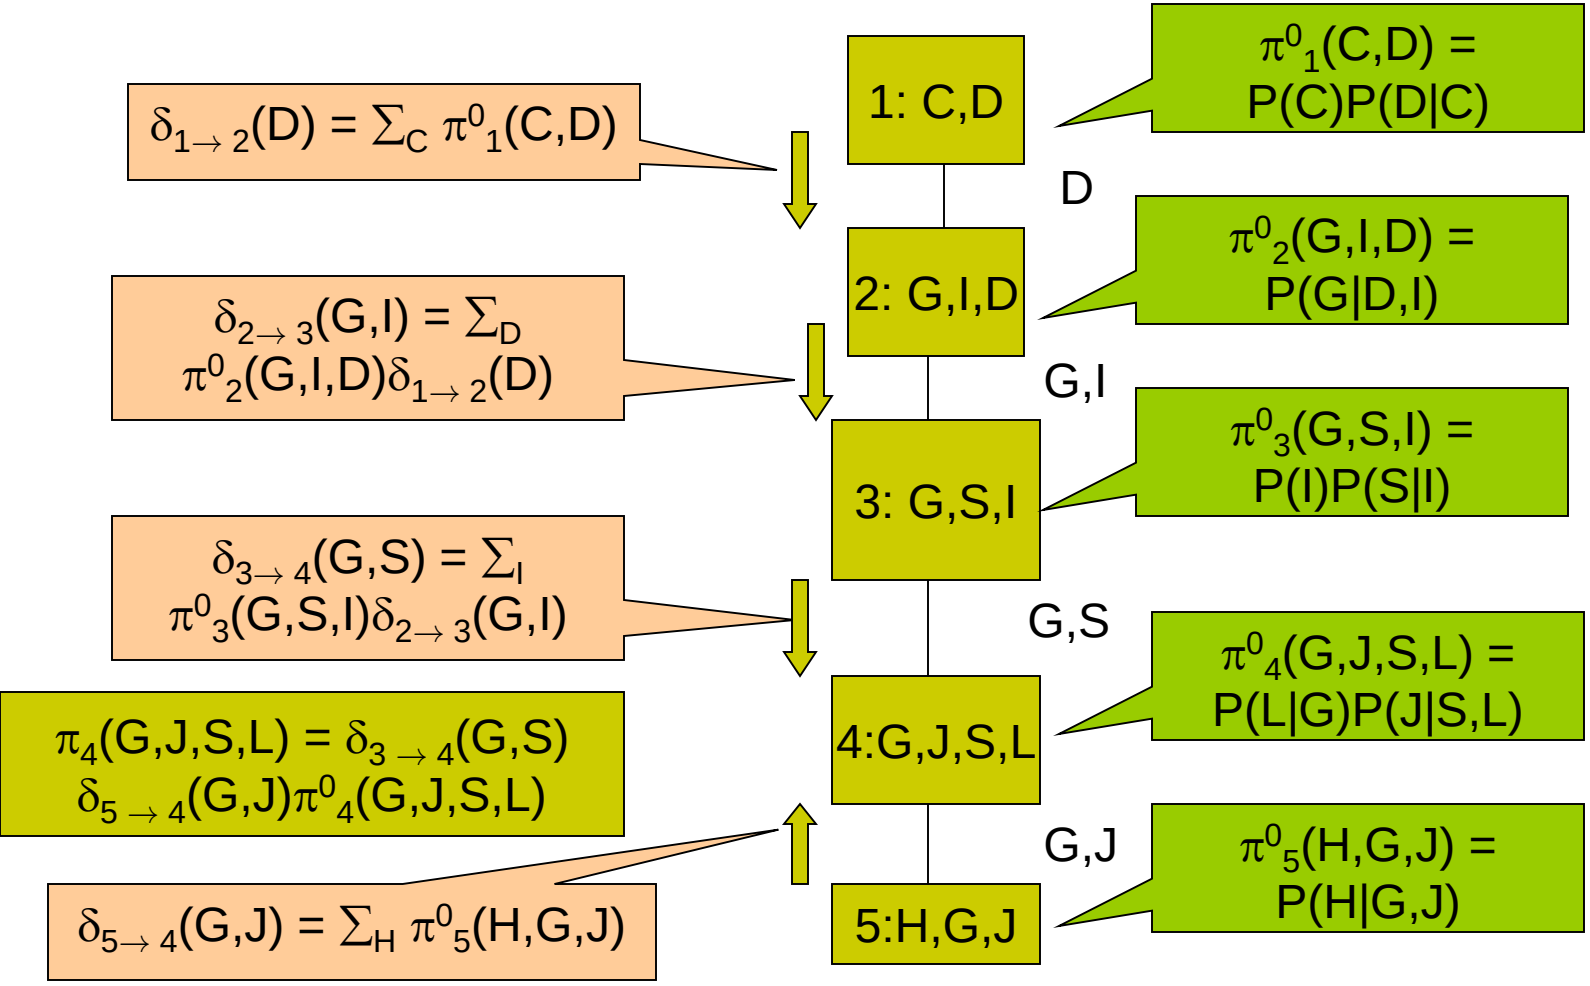
- Initialize potentials first:





Junction Trees to Variable Elimination:

- Pass messages: (C_4 is the root)



Junction Tree calibration

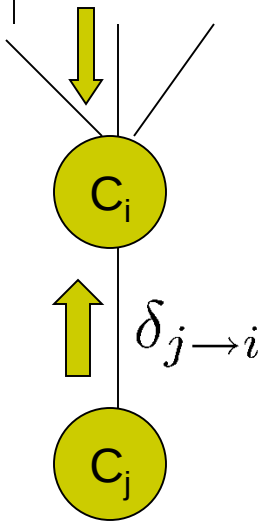
- Aim is to compute marginals of each node using least computation
  - Similar to the 2-pass sum-product algorithm

  - C_i transmits a message to its neighbor C_j after it receives messages from all other neighbors
  - Called "Shafer-Shenoy" clique tree algorithm

Message passing with division

- Consider calibrated potential at node C_i whose neighbor is C_j

$$\pi_i = \pi_i^0 \prod_{k \in N(i)} \delta_{k \to i} = \pi_i^0 \times \delta_{j \to i} \times \prod_{k \in N(i)-j} \delta_{k \to i}$$



- Consider message from C_i to C_j

$$\delta_{i \to j} = \sum_{\mathbf{C_i - S_{ij}}} \pi_i^0 \prod_{k \in N(i)-j} \delta_{k \to i}$$

- Hence, one can write:

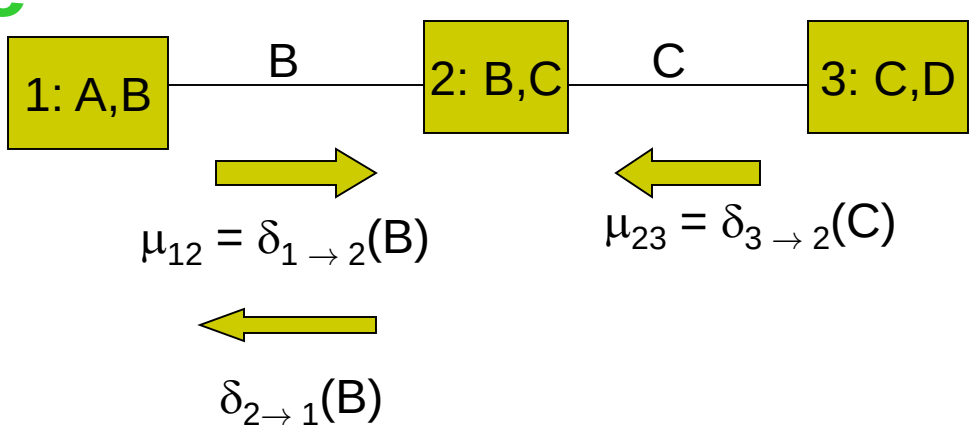
$$\delta_{i \to j} = \sum_{\mathbf{C_i - S_{ij}}} \frac{\pi_i}{\delta_{j \to i}}$$

Message passing with division

- Belief-update or Lauritzen-Speigelhalter algorithm
  - Each cluster C_i maintains its fully updated current beliefs π_i
  - Each sepset s_{ij} maintains μ_{ij}, the previous message passed between C_i-C_j regardless of direction
  - Any new message passed along C_i-C_j is divided by μ_{ij}

Belief Update message passing

Example



$$\pi_2(B,C) = \pi_2^0(B,C)\delta_{1\to 2}(B)\delta_{3\to 2}(C)$$

$$\delta_{2\to 1}(B) = \sum_C \pi(B,C)$$

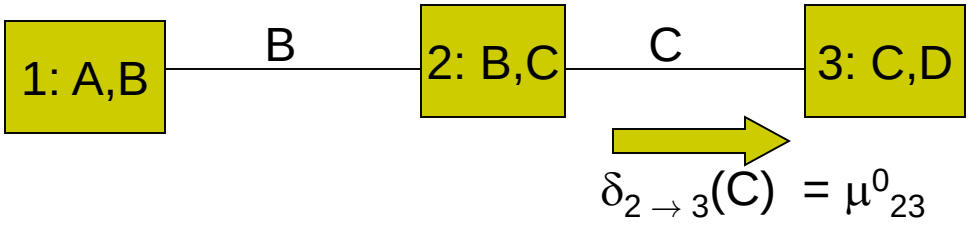
Actual message

$$m_{2\to 1} = \frac{\delta_{2\to 1}}{\mu_{12}} = \frac{\sum_C \pi(B,C)}{\mu_{12}} = \sum_C \frac{\pi_2^0(B,C)\delta_{1\to 2}(B)\delta_{3\to 2}(C)}{\delta_{1\to 2}(B)}$$

$$= \sum_C \pi_2^0(B,C)\delta_{3\to 2}(C)$$

This is what we expect to send in the regular message passing!

Belief Update message passing
Another Example



$$\delta_{2\to 3}(C) = \sum_B \pi^0(B,C) = \mu^0_{23}$$

$$\pi_3(C,D) = \delta_{2\to 3}(C)\pi^0_3(C,D)$$

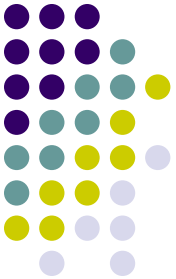
$$\delta_{3\to 2}(C) = \sum_D \pi_3(C,D) = \mu^1_{23}$$

$$m_{3\to 2}(C) = \frac{\delta_{3\to 2}(C)}{\mu^0_{23}} = \frac{\sum_D \pi_3(C,D)}{\mu^0_{23}}$$

$$= \frac{\sum_D \delta_{2\to 3}(C)\pi^0_3(C,D)}{\delta_{2\to 3}(C)} = \sum_D \pi^0_3(C,D)$$

This is exactly the message C_2 would have received from C_3 if C_2 didn't send an uninformed message: Order of messages doesn't matter!

Belief Update message passing
Junction tree invariance



- Recall: Junction Tree measure:

$$P(\mathbf{X}) = \frac{\prod_{\mathbf{C_i} \in T} \pi_i[\mathbf{C_i}]}{\prod_{(i,j) \in T} \mu_{ij}(\mathbf{S_{ij}})}$$

- A message from C_i to C_j changes only π_j and μ_{ij}:

$$\pi'_j = \pi_j \frac{\mu'_{ij}}{\mu_{ij}} \quad \Rightarrow \quad \frac{\pi_j}{\mu_{ij}} = \frac{\pi'_j}{\mu'_{ij}}$$

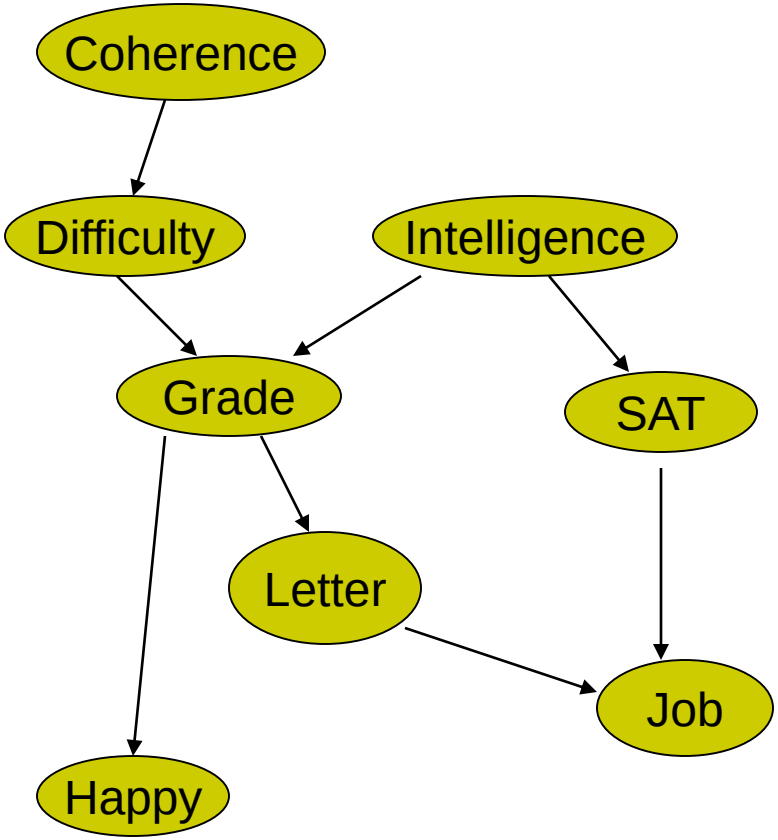
- Thus the measure remains unchanged for updated potentials too!

Junction trees from Chordal graphs

- Recall: A junction tree can be obtained by the induced graph from variable elimination
- Alternative approach: using chordal graphs
- Recall:
  - Any chordal graph has a clique tree
  - Can obtain chordal graphs through triangulation
- Finding a minimum triangulation, where largest clique has minimum size is NP-hard

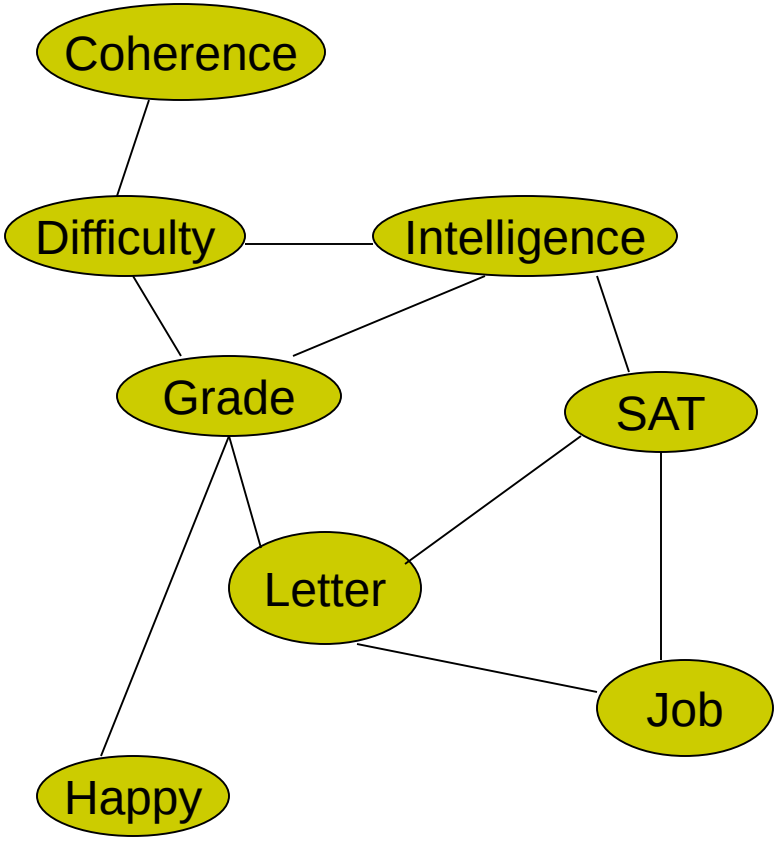
Junction trees from Chordal graphs
Maximum spanning tree algorithm

- Original Graph



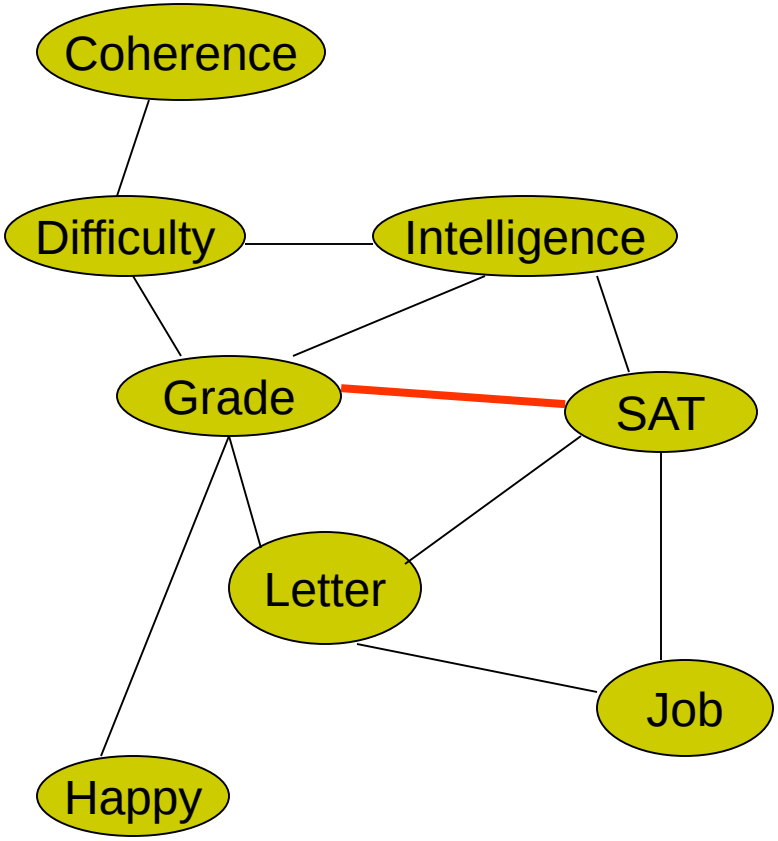
Junction trees from Chordal graphs
Maximum spanning tree algorithm

- Undirected moralized graph



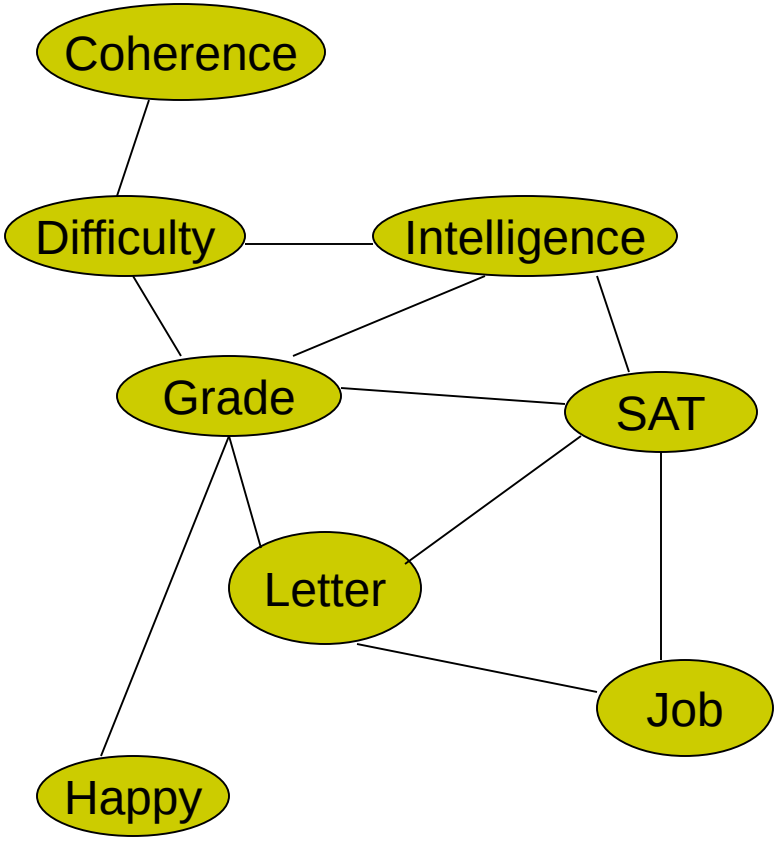
Junction trees from Chordal graphs
Maximum spanning tree algorithm

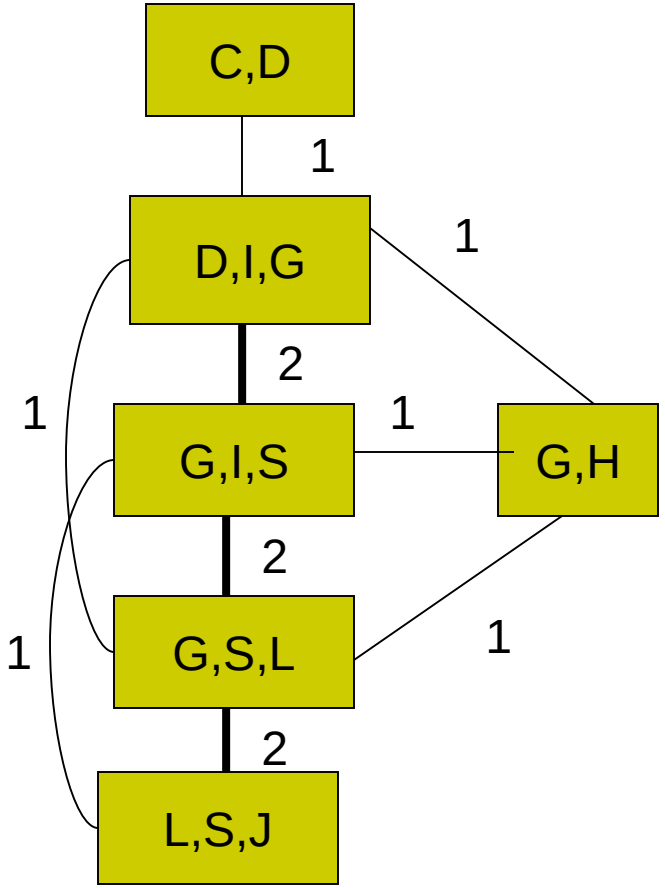
- Chordal (Triangulated) graph



Junction trees from Chordal graphs
Maximum spanning tree algorithm

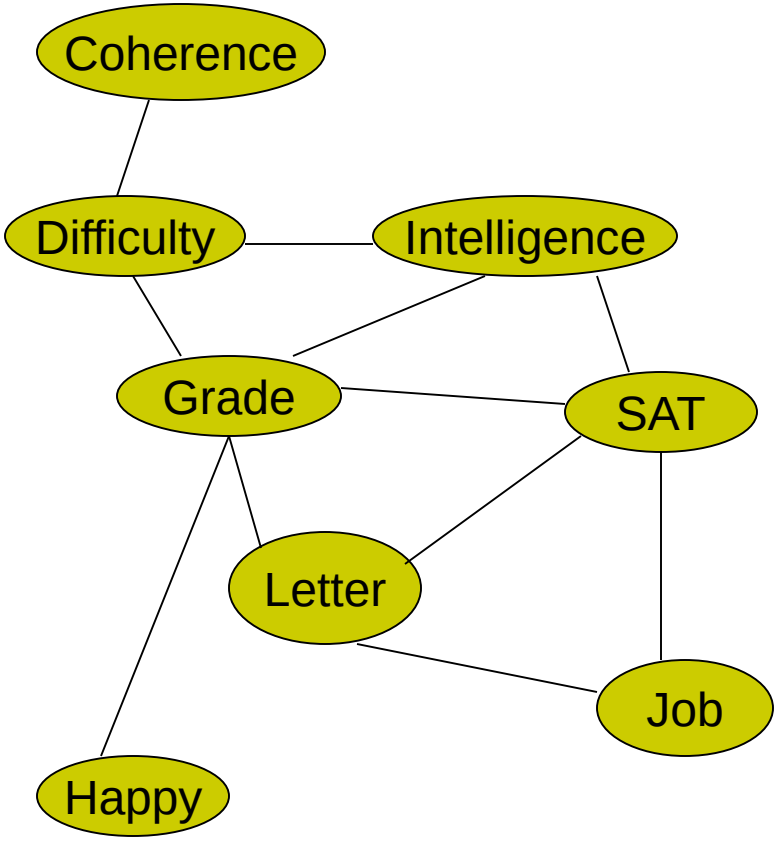
- Cluster graph

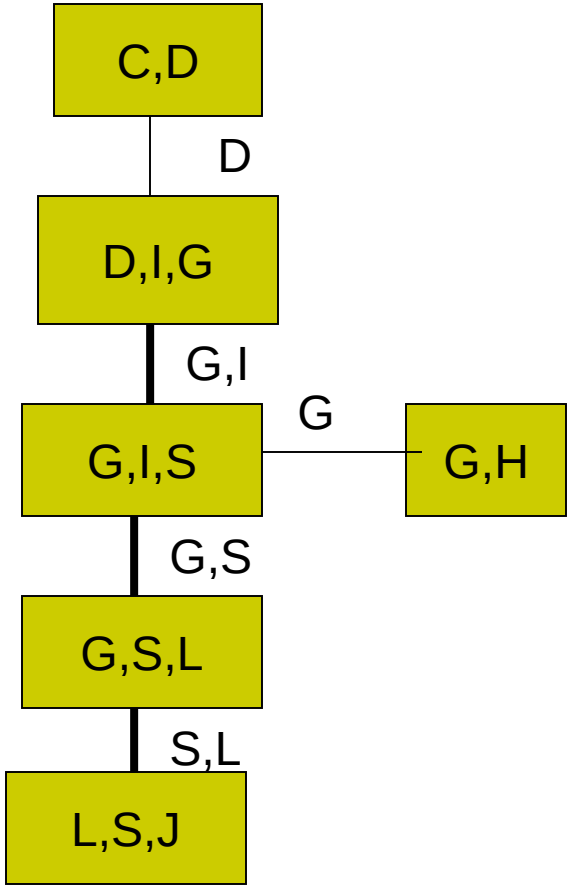




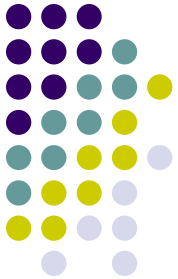
Junction trees from Chordal graphs
Maximum spanning tree algorithm

- Junction tree





Summary



- Junction tree data-structure for exact inference on general graphs
- Two methods
  - Shafer-Shenoy
  - Belief-update or Lauritzen-Speigelhalter
- Constructing Junction tree from chordal graphs
  - Maximum spanning tree approach
